

Site constraints giving you a headache?

No problem, ICS have the solution...

...with their new Flat Pack chiller system

Are you struggling to replace a chiller in a basement plant room or on a site with restricted roof access?

Then let ICS take the headache out of your chiller replacement with our **Flat Pack Chiller Technology**.

Whether you're looking to increase your chiller capacity or upgrade to the latest environmental and energy efficient technology, we have a solution for you.

With our bespoke build service here in the UK we can even help with **non standard** system replacements by designing and building a chiller to the **size** and **noise attenuation** you need for your site.

Complete Flat Pack Solutions

Why would you need flat pack cooling?

Many companies looking to invest in energy efficient cooling for their plant room or central HVAC system have found access a major concern.

With access to sub basement plant rooms often restricted to a staircase and service lift, options for siting a new chiller in the same location can quickly become a logistical nightmare.

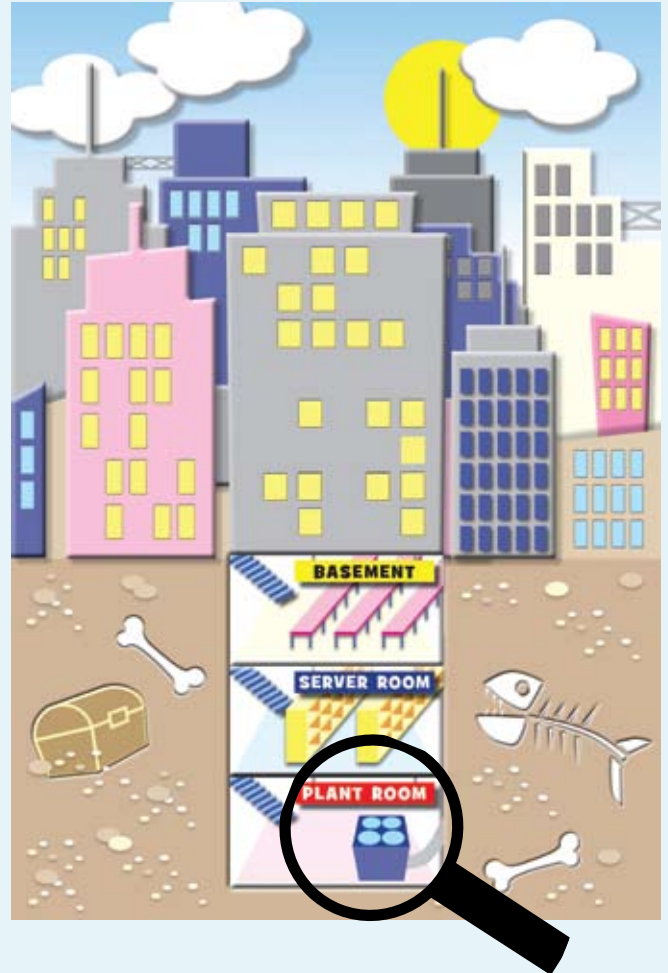

How does it work?

ICS, with their manufacturing company **Tricool Thermal** have been solving such logistical issues for many years through their flat pack technology. Standard and bespoke units are manufactured, tested and then broken down for transport and site access. Once delivered, units are taken in pieces to the required build site to be re-built, re-tested and installed in the required location.

Furthermore, with Tricool Thermal's manufacturing capabilities units can be built specifically for site incorporating **footprint restrictions, unit capacity, noise constraints, or a combination of these.**

To find out more...
